

Parivahan Sarathi

From fragmented transport portals to one clear, multilingual citizen journey.

BUILD WHAT MOVES INDIA

Independent hackathon prototype | Build 50 | 28 Aug 2026

Designed by the builder with OpenAI Codex

CITIZEN REALITY

The portal is organised by services. People arrive with moments.

A citizen does not wake up wanting a Form 4A or a hypothecation workflow. They want to drive legally, avoid a fine, replace a lost document, or know what to do next.

DESIGN QUESTION **How might we reduce the effort to understand, prepare for and complete transport-service journeys - without pretending the prototype is an official system?**

RESEARCH SYNTHESIS

Five signals shaped the product direction.

We combined official-source desk research, repeated prototype tests, public-service constraints and explicit hackathon safety rules.

01 Complete journey beats static redesign

The brief asks reviewers to finish the main citizen journey, not inspect an admin panel.

02 Mobile is the default constraint

Real Indian users may have slower connections, smaller screens and limited portal familiarity.

03 Mocking is a safety feature

Synthetic records and simulated integrations are appropriate where OTP, payment or production access is unavailable.

04 Transport services are form-heavy

Official forms repeatedly collect identity, licence, vehicle, travel and supporting evidence.

05 Trust needs visible boundaries

Sources, state variance, draft status and official handoff must remain visible at consequential moments.

ITERATION

The design moved from “vehicle dashboard” to “citizen guardian.”

Each shift came from a concrete usability question raised during critique and testing.

01

Vehicle health score

Too abstract. It centred the account on one vehicle and made a score the goal.

03

Status over scoring

“Expires in 28 days” is actionable. A 72/100 ring is not.

05

Optional profile

Onboarding moved to mobile number; challan quick-pay remains possible without portal credentials.

02

Person-centred profile

Ravi owns a licence and multiple vehicles. The person became the account root.

04

Recognisable vehicles

Real vehicle imagery improved recognition for citizens who may not read every label.

06

Citizen-controlled agent

Automation prepares and validates, while CAPTCHA, OTP, declarations and payment stay with the citizen.

RESULT

One profile. One prioritised action. One safe path to the official service.

NORTH-STAR MODEL

Organise around the citizen, not the department.

The interface answers three questions in order: What needs attention? What does it mean? What can I safely do now?

THE DECISION HIERARCHY

- 1 Urgent obligation**
Deadline, consequence and one primary action
- 2 Understand**
Plain-language explanation and visible source
- 3 Prepare**
Checklist, prefill, validation and correction
- 4 Act safely**
Citizen confirmation and official handoff
- 5 Close the loop**
Receipt, status or recoverable pending state

END-TO-END

The hero flow is one complete citizen journey.

Driving-licence renewal demonstrates the core pattern; other services reuse it.

**ONE PATTERN, MANY SERVICES**

Renewal, ownership transfer, address change, loan-record removal, lost documents, IDP preparation and challan payment all use the same visible states.

RESPONSIVE WORKSPACE

Urgency first on every screen size.

Desktop supports scanning across a transport profile. Mobile keeps one action and five primary destinations within reach.

INCLUSIVE BY DESIGN

Lower reading, memory and connectivity demands.

Accessibility is treated as a product requirement, not a final compliance badge.

2 interface languages

English, Hindi and Tamil primary navigation and dashboard states.

Plain-language terms

Driving licence, vehicle registration and pollution certificate before acronyms.

Offline and share

Citizen-triggered local snapshots and native share intent, clearly labelled non-official.

Keyboard-safe dialogs

Focus enters, stays inside, closes with Escape and returns to the trigger.

Mobile-first hierarchy

The deadline and primary action arrive before the visual garage or service catalogue.

FORM AGENT

Automate preparation. Preserve citizen authority.

International Driving Permit preparation was chosen because Form 4A mixes reusable profile data, trip-specific fields and documentary evidence.

sample profile - Form 4A

International Driving Permit

+ Sarathi Form Agent - Eligibility

Where are you planning to drive?

An IDP is issued to an eligible Indian resident holding a valid Indian Driving Licence.

Demo eligibility match
Ravi's synthetic Indian DL is valid and his profile residence is India. Final eligibility is decided by the licensing authority.

Country to be visited
United Arab Emirates

Departure date
15/09/2026

Expected return
30/09/2026

Destination driving rules, IDP recognition, visa requirements, and validity must be checked before travel.

Check documents --

SARATHI CAN

- Reuse verified synthetic profile fields
- Collect and validate trip details
- Check required evidence
- Map values to a local draft
- Explain caveats and cite the source

CITIZEN MUST

- Review every field
- Handle CAPTCHA and OTP
- Accept declarations and signature
- Authorise payment
- Complete final submission

PRODUCTION PATH

AI explains. Deterministic systems decide. Citizens authorise.

The architecture is intentionally more conservative as consequence increases.

BUILD EVIDENCE

The product changed because testing found real friction.

The regression history records the move from functional prototype to reliable citizen experience.

THE PRODUCT THESIS

Better public digital experiences start with the next human decision.

Parivahan Sarathi does not replace the state. It reduces uncertainty before the official interaction: what needs attention, what it means, what to prepare, and how to know the task is complete.

SIMPLER

One prioritised action instead of a portal directory.

INCLUSIVE

Mobile, multilingual, plain-language and offline-aware.

RESPONSIBLE

Synthetic data, visible mocks and citizen-controlled authority.

THE ONE-LINE PITCH

A multilingual transport guardian that finds the next important task, explains it plainly, and prepares citizens for a safe official handoff.

Independent prototype

Synthetic records and simulated AI, payment, notification and government integrations.
